

The Problem

Vitamins and Supplements have become a part of our daily routines, but what schedule do we follow? The supplement market is highly competitive, making it challenging to determine which supplements to take and when to take them. Especially when multiple supplements are available, it is not possible to take them all at the same time, so scheduling becomes necessary to establish a more efficient supplement intake.

The Tools

Uploading different materials used in the making of this project into a GitHub repository to keep track of the project as well as keep record of the project to use as a portfolio.

Coding using python language when developing the model that the website will be run on. Testing the data accuracy and system output.

Storing the dataset as an excel file so it can be run in the python code. Cleaning the features of the dataset in the excel file. Using filters to look through the datasets formatting.

Aims & Objectives

To build a user-friendly web application using data-driven insights to generate personalised schedules to help users effectively implement and manage their daily nutrient intake.

- Review articles with information about supplement dosages
- Use Python to preprocess the supplement dataset
- Develop a web-based prototype with a personalised supplement schedule

The Solution

A website that provides personalised schedules based on the supplements inputted, It will take into account the recommended effective dosages and times to take these supplements throughout the day, for a more efficient outcome. Supplements are more effective when taken at the correct dosage and at specific times of the day, which most users are not aware of. Once a personalised schedule is created for the user, they should notice a change in the effectiveness of the supplements they take.

The Skills

Researching relevant sources to use for the project

Programming the model based on the data for the website

Designing the user interface to make it user friendly and informative

Web deployment to make the website available for users

The When
